/CHIEH M FAN/ Supervisory Patent Examiner, Art Unit 2611			

Continuation of 11. does NOT place the application in condition for allowance because: applicant's remarks Matsumoto does not disclose an antenna and accordingly there is no possibility in Matsumoto that the dummy bits are assigned for transmission to an antenna that is not used for transmitting data. The examiner respectfully disagrees. Matsumoto discloses a communication system and a method of performing data communication between a plurality of communication units allocating (assign) dummy bits for transmission, that is, dummy bits are assigned to portion of the data transmission time to which the data to be transmitted is not assigned, meaning that only the dummy bits are assigned for transmission that is not used for transmission of data. Matsumoto further discloses use of ADSL modulator and demodulator (modem) with access to transmission and reception of signals. It is well known that ADSL can be operated in a wireless mode and that a gateway is commonly provided and used to make an ADSL connection to a wireless access point, it is also commonly known in the art of communication that in order to transmit and receive wireless signal into a wired device such as ADSL, an antenna or antennas is generally utilized as would have been obvious to a person of ordinary skill in the art to make use of of the already known and commonly practiced art in communication with antennas and as disclosed in Matsumoto use of discrete multitone with ADSL for data block allocation and bit communication (page 1, sections 006-0011; page 2, sections 0012-0014). In conclusion, applicant's arguments are not deemed persuavsive in attempting to overcome the above rejection, and the rejection maintained.
